RED 3.4 Installation procedure

2016-02-03, HSTO

1.   License

RED 3.4 is open source software under the Apache 2.0 license. This means, among other things, that we are not liable to damages, and provide no guarantees whatsoever for RED.

2.   Preparation

RED requires a little below 100MB on your disk. RED also requires the font "Kristen ITC" to be installed. If it is missing, your "sketchy" visual elements will have the same font as the "orderly" ones, which is very confusing.

3.   Installing

The installation as such is trivial. Just unzip the downloaded release to a place you like, and execute the red.exe file. You may want to create a link ("shortcut") on your desktop or wherever you keep things like this.

4.   Checking

Run RED, load one of the sample case studies, and play around with it. If you encounter strange behaviors, in particular on unsupported platforms, and you cannot find a reference to them in the FAQ or Known Bugs sections, you might want to let us know about it. Or better still, fix it!
